

JERZY SIELAWA

JACK PEROLO

SURVEY OF SHORT WAVE

BROADCASTING STATIONS

OPERATING IN THE 60 m. BAND

Period: 1957-1974

1974.

São Paulo

Brazil

ABOUT THE AUTHORS

JERZY SIELAWA

Jerzy is Head of the Department of Aerodynamics at I.T.A. (Instituto Tecnologico da Aeronautica) at São José dos Campos, SP.

Having attended the Gdańsk Polytechnic Institute and the University of Michigan, where he got an advanced degree in Aerospace Engineering, Jerzy is 43, married, four children, being involved in DX'ing since 1945.

Jerzy's primary interest are Far East stations and propagation analysis. One of his main contributions to DX'ing has been the development of short-wave band coded graphical loggings, condensing a considerable amount of informations in limited space.

GIACOMO PEROLI

"Jack" is Managing Director of MikroPul do Brasil in São Paulo, SP, the local subsidiary of a North American industrial equipment manufacturer, holding a degree in Industrial Chemistry from Genoa Institute of Technology and another in Electronics Engineering from the Milwaukee School of Engineering.

Single, 39, Jack has been DX'ing since 1949 being primarily interested in Latin American stations and DX below 6 MHz.

Using Jerzy's graphical approach as a starting point, Jack has done developmental work on it since 1962, and it is from his logs that the bulk of the informations reported herewith was extracted.

INTRODUCTION

With the interest aroused by DX'ing in recent years, different organizations have already published band surveys varying greatly in scope and in detail. While the I.T.U. listings are probably the most authoritative and professional in the field, they are limited to "International" short wave bands, i.e. over 5,900 KHz; an additional shortcoming of the I.T.U. publication is that it reports listed schedules and stations, without any guarantee that such station were effectively operating as reported: in fact, some Latin American broadcasters listed by I.T.U. not only never went on the air, but actually never owned a short wave transmitter.

On a less professional level, band surveys published by different DX Clubs appear to be of the fast obsolescent variety in view of the intrinsically volatile nature of the short wave bands associated with the fact that most such surveys only cover a certain band at a certain date.

The primary purpose of this survey is to provide the user with an indication of what channels a station has already made effective use and that, even tho it might be inactive at present time, may be reactivated in the future; the most recent year in which the station was logged is therefore listed next to the station for such purpose.

The authors were particularly critical in screening out informations from outside sources: since reliability and accuracy should come in first place even at the risk of omitting some possible informations, items originating from doubtful sources and lacking satisfactory confirmation were omitted from this listing.

To further define the source of a reported piece of information, the stations actually heard by the authors are conveniently coded as to offer to the user an additional hint on the origin of a certain report.

It is worth adding that this survey is the synthesis of more than 6,500 hours of actual DX'ing time, being primarily derived from more than 160 short wave logs, distributed evenly over a period in excess of 12 years.

The station call and location, specially for Latin American outfits, were taken whenever possible from station verifications, as to dispel conflicting indications from other sources.

Convenient empty space is provided throughout this survey to allow the individual user to add his own remarks and new loggings.

The authors cannot anticipate at this time whether in the future will be published an updating of this survey. At any rate, comments and suggestions will be permanently welcome at this address:

REFERENCE CODE

An arbitrary set of codes has been used throughout this survey as to convey most synthetically the largest amount of information of interest. It is recommended to the serious user, more so than to the casual reader, to become fully acquainted with these codes in order to take advantage of the complete meaning of the informations reported.

1. The primary objective of this survey is the 60 meter tropical band, spanning 4,750 to 5,050 KHz; for the sake of completion, however, the frequency range surveyed is somewhat larger, covering approximately from 4,200 to 5,200 KHz

2. All pages follow the same pattern, and include:

2.1 Top left: a free space for the user's remarks

2.2 Top right: nominal frequency in KHz of the last station reported in the previous page

2.3 Left column: frequency on which the station was/is operating (Ex. 4,710)

2.3.1 The whole survey is ordered by increasing frequency

2.3.2 All frequency readings are rounded to the nearest KHz

2.3.3 If the frequency is underlined, the corresponding station was actually heard by the authors (Ex. 4,710)

2.3.4 When the frequency is followed by /1 means that the station drifted ± 1 KHz over the nominal frequency reported (Ex. 4,710/1)

2.3.5 Ditto, /2, ditto ± 2 KHz (Ex. 4,710/2)

2.3.6 Ditto, V, means a drift in excess of ± 2 KHz (Ex. 4,710 V)

2.3.7 When the frequency is followed by +1 means that the station shows a preferential positive drift of 1 KHz (Ex. 4,710+1)

2.3.8 Ditto, +2, ditto 2 KHz (Ex. 4,710+2)

2.3.9 Ditto, -1, ditto -1 KHz (Ex. 4,710-1)

2.3.10 Ditto, -2, ditto -2 KHz (Ex. 4,710-2)

2.3.11 When the letters HARM are reported below the frequency (Ex. 4,710^H) means that the signal heard HARM was not a planned fundamental emission but the

accidental harmonic of that broadcast.
The harmonic frequency is always an integral multiple of the fundamental emission.

2.3.12 When the letters SP are reported below the frequency (Ex. 4,710) means that the signal heard was not SP

a planned fundamental emission but the accidental spurious of that broadcast.

No fixed relationship exists between the spurious emission and the corresponding fundamental signal.

2.4 Second column: station name, call (if any), and station location. In some occasions the same station is reported twice under the same channel due to the change of the station name and/or the country name

2.4.1 Russian and Chinese Regional Stations have their frequency doubly underlined when heard by the authors with positive identification of the transmitter location (Ex. 4,710). Otherwise the location reported has been primarily extracted from the World Radio Handbook, being of limited reliability.

2.4.2 A question mark following the station name indicates that such name has not been positively confirmed (Ex. R.Tacuiti (?)

2.5 Third column: alternate frequencies (not dual channels) used by the station in other occasions; alternate channels are only reported if located within the 60 meter band.

2.5.1 The meaning of /1, /2, V, +1, +2, -1 and -2 is identical to what reported under Items 2.3.4 thru 2.3.10

2.5.2 Each of the alternate frequencies is reported again as a main frequency, together with the corresponding date and BLT (Best Listening Time).

2.5.3 Some alternate frequencies are printed in brackets (Ex. (4,710) thus indicating that, even tho effectively heard by the authors, they are not reported separately as per Item 2.5.2, because of their proximity to some other frequency used by the same station and marked V, therefore indicating a drifting channel.

2.6 Fourth column: latest year in which the station was logged operating on the frequency reported in the first column. Therefore, should one wish to find the most recent year in which a station was operating on an alternate frequency, the user should refer directly to the alternate channel in question.

2.7 Fifth (last) column: since the authors live only 96 highway km. apart, the best listening time (BLT) is essentially the same for both locations.

BLT is defined as the time in which, over the years, a station shows peak readability in São Paulo, Brazil at 23°40'S and 46°35'W; such time is coded by underlining the proper figure (Ex. 0700)

2.7.1 Alltimes reported are Brazilian Standard Time (BST) using the 24 hr. system. Add 3 hr. to get GMT.

2.7.2 An F preceding the time notation, indicates that the station fades in at the time reported (Ex. F1910)

2.7.3 An F following the time notation, indicates that the station fades out at the time reported (Ex. 0730F)

2.7.4 A star * preceding the time notation indicates that the station signs on at the time reported (Ex. *0300)

2.7.5 A star * following the time notation indicates that the station signs off at the time reported (Ex. 0100*)

2.7.6 An A following the time notation and sign off sign indicates that the station closes down with the National Anthem (Ex. 0100*A)

2.7.7 A V following the sign off sign indicates that the sign off time varied substantially from day to day (Ex. 0100*V)

2.7.8 A time notation in bracket, followed by a star (Ex. 0200*) indicates the alternate sign off time for the station

2.7.9 Two times separated by a dash indicate that the station was heard throughout the time span reported (Ex. 0000-0100)

2.7.10 Two times separated by a coma indicate that the station was not continuously heard between the two times reported (Ex. 0000, 0100)
